

R4V3 · Product Requirements Document

Version 1.0 · May 2026 · Stage: Near Launch / Beta

A Product Requirements Document (PRD) outlines **what** you're building and **why** your ideal user wants it — the platform's purpose, features, functionality, and behavior.

Section 1: Purpose

Intro — Elevator Pitch

- For: Nightlife attendees, rave-goers, and underground music fans ages 18–35
- Who: Want a single, curated hub to discover, track, and coordinate around events
- The: R4V3 is an event discovery & social coordination platform
- That: Aggregates events from Dice, Posh, and other sources with music previews and friend-layer coordination
- Unlike: Scattered Instagram DMs, Google searches, and individual ticketing apps
- Our Product: The go-to app where the scene lives — find the event, hear the music, go with your people

Who Is It For?

Primary users are nightlife attendees and rave-goers who currently discover events through fragmented channels. Secondary users include event organizers and promoters who want visibility into a niche-focused audience.

Why Build It?

- Background: Event discovery for niche nightlife is broken — no single platform owns the underground scene
- Assumptions: Users trust music taste as a signal for event quality; friend social proof drives attendance decisions
- Market opportunity: The global nightlife industry is a multi-billion dollar market with no dominant discovery layer for electronic/underground events
- Company goals: Own the pre-event discovery and coordination moment to build a defensible social graph around nightlife

Section 2: Features and Functionality

What Is It?

R4V3 is a web and mobile-accessible platform that ingests event data from Dice.fm and Posh.vip, enriches it with Spotify music previews, and surfaces it via a curated, filterable feed. Users can discover events, preview artist sounds, and coordinate attendance with their network.

Core Features

- Aggregated event feed from Dice.fm + Posh.vip scrapers (Node.js/ESM ingestion pipeline)
- Spotify music preview enrichment at ingest time — 30-second previews on every event card
- Event cards with artist info, venue, date, genre tags, and ticket links
- Social coordination layer — see who else is going, express interest
- Filter and search by date, genre, city, and venue

How Does It Feel?

R4V3 should feel like flipping through a record crate — tactile, music-first, and built for people who care deeply about the scene. Dark aesthetic, fast, no noise.

Technical Foundation

- Backend: Node.js (ESM modules) + Supabase for persistence
- Data: Scrapers for Dice.fm and Posh.vip with reusable enrichment modules
- Music: Spotify Web API (client credentials flow) for preview injection
- Frontend: TBD / web-first at launch

Section 3: Release Criteria

Minimum Requirements for Release

- Functionality: Event ingestion running on schedule; Dice + Posh feeds populated; Spotify previews loading on ≥90% of cards
- Usability: Mobile-responsive layout; event discovery flow completable in <3 taps
- Reliability: Scraper uptime ≥95%; Supabase data freshness <24 hrs
- Performance: Event feed loads in <2 seconds on mobile
- Supportability: Error logging in place; failed enrichment jobs retried automatically

Section 4: Timeline & Constraints

Ideal Launch Date

Q2 2026 (Beta) → Q3 2026 (Public)

Known Constraints

- Budget: Bootstrapped / self-funded; infrastructure costs must stay lean (Supabase free tier → paid at scale)
- Timeline: Solo or small team development; scope must stay tight for beta
- Resources: Spotify API rate limits and scraper ToS exposure are active risks
- Dependencies: Dice.fm and Posh.vip scraper reliability; Spotify API availability and credential refresh

Additional Resources

Include links to finalize product requirements: event card design mockups, Supabase schema diagram, scraper architecture doc, Spotify enrichment module README, and staging environment link for beta review.
